## Ultrasonic Cavitation Therapy

Ultrasonic Cavitation is a non-invasive therapy which quickly breaks down fat, removes cellulite and lifts and tones your skin using advanced ultrasound technology. You can lose up to 2 inches in just one treatment with the Lipo Angel. No diet on earth can do that!

- Breaks down fat cells using ultrasound
- Clients lose up to 2 inches per session
- Surgery Free
- Pain Free
- No recovery time.

Ultrasonic Cavitation works by the ultrasound waves targeting fat cells in the desired area and breaking them down, so the body can dispose of them naturally via the lymphatic system, usually expressed by urinating. This fat loss is permanent and you can lose up to 2 inches in the area that has been worked on. This loss is noticeable straight away after the first session and as your body continues to flush away the toxins and broken down fat cells over the next 72 hours, you may notice further inch loss.

Ultrasonic Cavitation is then followed by Radio Frequency with Red Light photon therapy, which firms, tightens and lifts the skin, as well as improving the appearance of cellulite.

**Radio Frequency:**

- Assists the cavitation process.
- Smoothers cellulite.
- Tightens and lifts the skin.
- Tones and gives wrinkle reduction.
- Helps with body shaping.

Radio Frequency and Red Light Photon therapy heats the layer under the skin where cellulite is found, creating a slimming and tightening effect on the cellulite tissues. This tightens the fibres, stimulating the production of collagen and elastin fibres which then separately tightens and lifts the skin, reducing signs of wrinkles and firming the skin to give a more permanent tightened and lifted look.

With Ultrasonic Lipo Cavitation, only one area can be treated in one session. After 72 hours, you can treat the same area or a different area. Areas that can be treated include: Abdomen,
